

GAMES.RANDCO

THE PROBLEM

- Beginners learn to write code before getting to actual work
- Traditional CS courses encourage students to explore various topics
- Existing code is often hard to understand, build, which is not the goal
- Students need to learn how to build things instantly, and not just how to write code

1 GAME DESCRIPTION

Describe a 2D game you want to generate, play, and use to learn how its code works.

OUR SOLUTION

1. The generated game provides a starting point, not a finished product.
2. Imperfections highlight where logic can be fixed, optimized, or redesigned making the learning active rather than passive.
3. Users see a real example of how ideas translate into code, including the messy parts.
4. By modifying and correcting the game, learners develop practical debugging and design skills.
5. Each prompt gives a new sandbox for experimentation.

DEMO TIME

TECH STACK

ISSUES WE ENCOUNTERED

- Streaming: Built custom SSE parser with
- Auth Flow: OAuth + sessions + MongoDB
- Route Conflicts: Proper middleware ord
- Code Safety: Sandboxed iframe execut
- Database: MongoDB Atlas cloud setup

FUTURE?

- **Game Sharing:** public links & gallery
- **Templates:** pre-built learning paths
- **Export & Deploy:** download or host game
- **Documentations:** have better dynamic c
- **Custom LLM:** better AI support

THANK Y
